Addendum: Urinary Incontinence with Second-Generation Antipsychotic Drugs

Our recent article entitled Lumateperone (*Caplyta*) for Adjunctive Treatment of Depression¹ should have included urinary incontinence among the adverse effects associated with use of second-generation antipsychotic drugs. Urinary incontinence has been reported with both first- and second-generation antipsychotics. Possible causes include the anti-alpha-adrenergic, antidopaminergic, and anticholinergic effects of these drugs, as well as sedation. In an observational study in 200 women 20-40 years old, urinary incontinence was reported by 29% of those taking antipsychotic drugs and by 13% of age-matched controls.²
